

We bring the voice of conservation to discussions about how the earth's resources are to be used."

~ Christopher W. Clark, director, Cornell Lab of Ornithology Bioacoustics Research Program

Who We Are

The Bioacoustics Research Program, founded in 1987 under the direction of Dr. Christopher Clark, is a department in the Cornell Lab of Ornithology.

We develop digital recording equipment, computer software, and algorithms that scientists around the globe use to study animal communications and monitor the health of wildlife populations in their natural environments.

We assist researchers, businesses, and government agencies they attempt to understand and minimize the impact of human activities on the natural world.

"Researchers, industry and government agencies turn to us for advice because of our commitment to biodiversity and our expertise in monitoring animals on land and in the seas."

~ Christopher W. Clark
