The History Channel had a program on Salmon that aired on October 6, 2010. In this program they noted that the U.S. Navy had invented a robotic salmon for surveillance purposes. When I saw this clip I immediately sat down and wrote this little story below for a 😊😊 and for fun.

SALMON FUTURES 🤖

The future salmon you eat will be quite tasty. 😊 It appears that the U.S. Navy 🇺🇸 has invented a robotic salmon 🤖 that will be used for surveillance purposes 😊 according to a History Channel story on salmon this evening (October 6, 2010).

You don't have to worry about eating Genetically Modified Salmon any longer 🇺🇸 as they will now be completely robotic and have an incomparable flavor of "spying" 🤖 engineered into them.

The taste will be "beyond comparison" as restaurants prepare this new dish for public consumption. 😊

You should note that the flavor will not be comparable to anything ever prepared before by world-famous chefs. 😊

And the added bonus is that the GPS hidden inside will be ingested so that the Navy can track us from cradle to grave. 🤖 And the best part will be eating this delicacy more often as they multiply in our oceans. Who needs the real thing...when robotic salmon is on the Navy menu? 😊

The good news is that fishermen and tourists will always be employed as they will have "ready-made" salmon to catch or view. 😊 We can also more easily track the birds and bears that eat the salmon. 😊

The nutritious food balance from eating "flavor-enhanced" robotic salmon will be advertised everywhere increasing sales and advertising revenues. 🤖

Thus, everyone will benefit from this bountiful Navy menu provided for us at taxpayer expense. 😊
